

Reflection – Manas Samant(227129):

During this lab, I was able to successfully work through several key tasks that strengthened my understanding of Google Cloud. I learned how to create and configure a serverless function, deploy code, and connect the function to Firestore. I practiced setting up triggers, reviewing logs, navigating Cloud Run interfaces, and accessing key resources within the console. I also gained hands-on experience verifying deployments, checking runtime behavior, and reviewing function execution details, which helped reinforce how different Google Cloud components interact in real-time.

Throughout the process, I improved my understanding of IAM permissions and service accounts. I learned how specific roles—such as Datastore User and Logs Writer—enable a function to securely access other resources. Monitoring logs and verifying updates in Firestore also helped me build confidence in troubleshooting and validating cloud-based applications.

One major challenge I faced was that I was not able to properly deploy the main.py and requirements.txt that were given to me. I faced many errors while deploying that. Solving this taught me the importance of verifying everything before deploying.
